

This thesis focuses on the design and development of a mobile application for Android platform. This application can be used for browsing and ordering meals at public canteens. Unlike other similar projects, this application is extensible by plugins. This approach gives the user the ability to browse meals from different canteens in the environment of one application. This application also supports multiple user profiles and works in off-line mode. This thesis also includes a few plugins as an example and plugin development documentation for the easy extension of new plugins.
