Abstract

The objective of this study is to create comprehensive overview of the development of partner forms in the Czech republic from 1961 to 2016 and their own analysis. This thesis is divided into two parts, where the first part deals with analyzes of individual partner forms, namely in the form of analysis of primo-nuptiality, especially from generation perspective, analysis of divorce rate, analysis of marriages of divorced and analysis of cohabitation. This diploma thesis is so independently connected to my bachelor thesis, using the same primo-nuptiality life tables which had been calculated by a uniform methodology for absolute mutual comparability. These life tables, supplemented by another two years, were also used here to calculate the indicators in the already mentioned generational view of primo-nuptiality. The second part of this thesis is then devoted to the analysis of the International Social Survey Programme for the Czech Republic, focusing only on the part of the Family for 1994 and 2012 and their mutual comparison and transitions.

Keywords: primo-nuptiality life tables, cohort, nuptial, marriage, divorce, cohabitation, ISSP, Czech Republic, IBM SPS
