

## Abstract

This diploma thesis deals with an evaluation of students' mobility through ERASMUS+ at Charles University. In the introduction, I consider the research questions related to this phenomenon and I earmark some specific areas which I am interested in this topic. In the first research section I analyze the registration forms of the students who took part in the exchange stay at Charles University and evaluate the motivation that influences their decisions. Furthermore, I assess these motivations using statistical analysis. In the second research part was done a questionnaire survey among students arriving and departing Charles University for an exchange stay and I focus mainly on three areas. The first of them is the motivation and real benefits of mobility for the students who have chosen to take part. In the second part, I am concerned with the fact if these exchanges have a real added value for students in the field of convergence in Europe and their support for next integration. The last part analyzes the possible main problem of this project and that is its financial difficulty, which affects the student mobility strategy across all Europe.
