

Abstract:

The thesis applies the neomedieval theoretical framework on the contemporary political map of the world. The thesis argues, that the contemporary international politics cannot be understood by an application of the unified geopolitical setting and that the key divergencies in the geopolitical environment play a crucial role for the actors operating in different regions. As an outcome of the theoretical works dealing with the selected theory, a three-world model is being presented dividing the political map among these settings – Durable Disorder (defined by networking and privatization), Westphalian System (defined by a dominant position of strong centralized state), and Chaotic Anarchy (lacking stable political power and control over means of violence). This model is consequently applied on the global political map with the consequent analysis of the strategies of different actors located inside specific environments and mutual interactions of these three worlds.
