Abstract

The main topic of this diploma thesis is the relationship of movie and human perception. Movie is a purely technical medium that moves images for the first time. The starting point of the work is the book written by French cultural theorist Paul Virilio and his reflections on film and technology. Virilio's position is negative in many ways due to cinematography. He blames technology for horrors inflicted during world wars. Cinematography is guilty of a revolution of perception that leads to the decomposition of the vision and the disintegration of the classical dimensions of space and time. In my work Virilio's views are confronted with the reflections of Virilio's contemporary, also the French theorist, Gilles Deleuze. Deleuze understands movie in many ways differently than Virilio. Also his opinion on the technique is quite different. The movie after World War II is a medium that no longer attempts to imitate natural perception. Such film can cause a shock to the audience. This shock opens up new possibilities of thinking and perception, and the viewer gains the opportunity to achieve a specific spiritual life through a movie.
