

The goal of this project is to write a program for mobile phones that will be able to create a network out of surrounding mobile phone by using the Bluetooth Protocol. It will be able to send media like text, audio, images and video (for those phones that support it). The program will also be capable of sending these media through the Jabber Protocol by using Uuencode/Uudecode. The program will be written in Java 2 Micro Edition a will be an add-on to an existing program "Mobber", in which the Jabber Protocol is already implemented.
