

This diploma thesis analyzes the potential of tourism in the Bohemian Forest Protected Landscape Area based on the point assessment of selected implementation factors. It examines the role they play in the final potential of the extinct settlements that are located 60 in the area. These settlements are categorized on the basis of the original population, the seat of the site and the visible remains. In detail, 10 of these settlements are selected, selected on the basis of their importance in the past and present. Their location, history and current status are described. The work uses graphs, tables, maps and own photos taken during the field survey. Former settlements in their present form do not have much influence on the overall potential of tourism in the area under consideration, but in some localities it is possible to increase the potential, for example, through the use of educational trails using the forms of local heritage interpretation (just represented by these sites). These are designed in the diploma thesis.
