

## **Abstract**

The thesis aims to explore and describe the relationships between scientific results and research projects, both in general and in three given sources: the National Repository of Grey Literature (NUSL) in the Czech Republic, the Czech Research, Development and Innovation Information System (IS VaVaI) and OpenAIRE. The theoretical part presents relationships between results and projects in the field of research information in the Czech Republic and the EU, as well as the Levels of Conceptual Interoperability Model (LCIM) and its application to the relationships between results and projects. Furthermore, the thesis examines the analyzed resources in terms of acquisition, technical processing and interoperability of links between results and projects. The research part quantifies the presence of these links in the given sources, examines the multiplicity of the links to projects, and a possible dependence of the occurrence and quantity of these links on language and type of the research results.
