

ABSTRACT

Validity of drawing as a projective test

The subject of this work is to investigate the relationship between a projective method, I specifically chose the Tree Test, and the Personality Questionnaire MMPI-2. The research question is as follows: What is the correlation between the clinical scales of the Personality Questionnaire MMPI-2 and the projective Tree Drawing Test? Both tests were assigned to adolescents from children's homes. I found statistically significant correlations in paranoia, hypochondria, hysteria and psychasthenia among men, I also looked for matches between individual clinical scales and the Tree Drawing in individual case reports. Unlike the research I present in my work, I have found areas where the projective Tree Drawing Test could correspond to personality characteristics as approached by the Personality Questionnaire MMPI-2.
