Title of the Bachelor Thesis: Comparison of Instruments for Determination of Individual Goals in Occupational Therapy in Patients with Acquired Brain Injury

Abstract:

The bachelor thesis deals with the use of three selected instruments for setting individual goals in patients with acquired brain injury. The aim of this work is to map the course of application of each instrument and their comparison in selected areas. Furthermore, the thesis focuses on the use of the instruments in patients depending on various consequences of acquired brain injury.

The theoretical part describes various types of acquired brain injury, their consequences and possibilities of rehabilitation. Then the recommended course of application of individual instruments is described.

The practical part describes the course of application of individual instruments in concrete clients. There is always an aphasic client and a client without aphasia for each instrument. This section also includes a subsequent evaluation and comparison of selected instruments in different areas, as well as various recommendations regarding their application.

Key words: individual goal setting, acquired brain injury, occupational therapy, Canadian Occupational Performance Measure, Kawa model, Person centred planning
