Ing. Jan Andreska, Ph.D.

Abstract

This bachelor thesis deals with how to use the geographical area of Černokostelecko for didactic purposes and above all what are the most interesting biological localities, in what time of year it is best to visit them and what we can demonstrate to them. One of the main advantages of the whole area is that it lies in close proximity to the capital city of the Czech Republic and therefore it is very easily accessible. As a further advantage, I would like to mention that there are no mountains or valleys of some wild rivers in the whole locality, and it is also quite densely populated, so there is no dangerous wilderness, so educators do not have to worry about any extreme danger. All the excursions mentioned in this work I have attended with the pupil of the first level of elementary school and they did it all perfectly. Educators really have nothing to worry about. Despite the fact that it is quite densely populated, it is also an area with a lot of naturally interesting places, which is definitely worth a visit. Many of the local natural (zoological, botanical and geological) points of interest are unprecedented anywhere else in the Czech Republic. This topic is elaborated in the form of four excursions throughout the school year and each of them shows their main objectives and how to achieve them. In the final part of the thesis there is an evaluation of both individual excursions and evaluation of excursions as a whole.
