

Abstract

This thesis presents archaeological finds from the site “U silnice”, in municipality Plaňany (district Kolín), where a settlement from roman period has been found during excavations in 2016 and 2017. An assemblage of excavated finds consists mostly of ceramic, animal bones and daub. The aim of the thesis is to describe qualitative and quantitative attributes of these finds. Results will be used to validate and compare properties of individual archaeological contexts. Main goal is to place the site into regional network of settlements and cemeteries from roman period. Potential of the site rises from the fact that it is the only settlement from roman period excavated by modern methods in the region and therefore it represents a valuable source of new information.
