

ABSTRACT

Bachelor thesis entitled Ichthyosis – A disease of the whole family deals with the disease Ichthyosis, its types, heredity and quality of life of patients. The work is divided into a theoretical part and a practical part. In the theoretical part I present an individual types of diseases, possibilities of diagnostics, therapy and the influence on the labour of a mother of a child with this disease. In the practical part, I examine the period of the first signs of childhood disease, the impact on childbirth, the attitude of parents of a child with ichthyosis to plan another child and the degree of a daily burden for patients and their caregivers. I carry out the research in the form of a questionnaire sent out among the families whose members suffer from the given disease and a supplementary questionnaire, which was presented to the mothers of healthy children. The work is focused on greater public awareness of Ichthyosis, the necessary care of the skin of the affected and the non-infectiousness of this disease. The most popular products for relieving clinical symptoms are introduced in the attachment No. 3.
