

Abstract: In this bachelor's work, I deal with the paraphrasing of text at the word level, namely the paraphrasing of biblical texts in Czech. Paraphrasing should also include modernising the text to make it easier for the average reader to understand. For this purpose, I have developed a desktop user application in which I use tools to analyze and generate language: Word2vec and MorphoDiTa. In my work, I compare the results of each approach in paraphrasing. The evaluation of the results follows several criteria and compares the effectiveness of the methods used on verses from czech translations: Bible kralická and Český ekumenický překlad.
