

Název práce: Magneto-optická spektroskopie tenkých vrstev perovskitů s kolosální magnetorezistencí

Autor: Martin Veis

Katedra (ústav): Fyzikální ústav Univerzity Karlovy

Vedoucí diplomové práce: Prof. Ing. Štefan Višňovský, DrSc.

e-mail vedoucího: visnov@karlov.mff.cuni.cz

Abstrakt: Magneto-optical spectra of perovskites with ferric cations in region from 2 to 6 eV show rich structure and sharp lines. Their electric resistance is high. This is produced by only one type of cation with five 3d electrons, which is situated in the center of oxygen octahedron with lower symmetry. The substitution of ferric cations by manganese ions with mixed valence changes radically electric resistance, crystallography structure and optical properties. These properties haven't been study yet. Diploma thesis is focused on magneto - optic spectroscopy of thin films in region from 1 to 5 eV with dependence of thickness in region from 20 to 60 nm to explore electronic structure of these films.

Klíčová slova: Kerr effect, $La_{2/3}Sr_{1/3}MnO_3$, Pulsed laser deposition

Title: Magneto - optical spectroscopy of perovskites thin films with colossal magnetoresistance

Author: Martin Veis

Department: Institute of Physics, Charles University
