

Supervisor's review of the thesis "Proteins interacting with oxygen and its reactive species in *Naegleria gruberi*" by Ronald Malych

It is very easy for me to review the thesis of Ronald Malych. He succeeded in expression, isolation, and partial characterization of three different native proteins whose function and biochemical properties are rather unknown. Moreover, he developed antibodies against these proteins that are frequently used in our laboratory. Ronald was working unusually independently and efficiently; the results of his thesis, as well as his side projects, have already been used in three publications, while the main data are still to be published. The writing of his thesis went smoothly, and I can thus only recommend the best grade for his effort.
