

**Abstract (in English):**

*The main aim of the presented thesis is to reconstruct the early medieval settlement in the vicinity of the Prague-Vinoř stronghold in as much details as possible and to describe its relation to this central locality. In addition, issues of the general character of this historical landscape are discussed, such as the spatial relationship between the settlement and funeral areas or the stabilization of the settlement network. The work was based on very diverse sources consisting of two phases of large-scale surface prospection and small-scale destructive researches. The obtained data differed greatly in their character, spatial distribution, and reliability, which led to the need to create a model that would allow their interconnection. According to it, specific settlements and burial grounds were defined, which became the basis for solving the issues described above.*
