

ABSTRACT

The bachelor's thesis on the topic "Activation of a child patient in hospital care" is focused on finding out the activities performed in the Motol University Hospital, we focused on employees who perform the activities and what tools they use, as well as staff satisfaction with the possibilities of activities. The work is divided into theoretical and empirical part.

The theoretical part is focused on the characteristics of childhood, discusses the role of the nurse in the pediatric ward, the pediatric patient and communication with the pediatric patient. At the end of the theoretical part, various possibilities of activities and the role of volunteers in the departments are described.

The empirical part consists of a survey questionnaire survey, which was focused on nurses working in the Motol University Hospital in the wards in the children's section.
