

The present work is focused on the problem of processing huge amount of information on the Internet. This task's importance is constantly growing in present days along with the increasing amount of available information. The goal was to develop an application that would solve this problem for one concrete, frequently used area and simplify the user the time-consuming task of data analysis. The program is designed for searching data occurring in on-line shop databases. The technologies used in this application were chosen in a way to satisfy two conditions: to facilitate usage to the end-user and at the same time to enable program's platform independence.
