

Summary

Title: Personality of scuba diver and his sensation seeking tendency.

Aim of work: An analytical comparison of the sensation seeking tendencies between scuba divers and non-divers.

Methods: Participating in my research project were 44 members of scuba divers club and 35 non-divers. I had used Kuban's Sensation Seeking Scale and Eysenck's personality questionnaire.

Findings: The findings of my thesis confirm determine my hypothesis. Scuba divers have a higher tendency for seeking sensational emotions. Reversely the non-divers have a higher score of lability.

Keywords: scuba diving, personality, experience, flow, motivation, reversal theory
