

Substantiation of Electronic Evidence

Abstract

The author focuses on the possibility of “misuse” of data as electronic evidence in the thesis. She describes specifics of electronic evidence and she points out that current technologies are so advanced that they are able to track and map the lives of individuals. The author simulates the investigation of the crime of murder, based on the idea, that thanks to the daily stored data on digital activity of persons in conjunction with GPS data, the physical activity of persons can be proven. She seeks to investigate this crime regardless of the regulation of fundamental human rights and freedoms only by electronic evidence. Eventually she assesses the procedure in the light of legislation. Finally, the author deals with the issue of confidentiality obligations of attorneys at law in connection with the use of electronic devices for the performance of their activities and she points out specifics of search of premises, where attorneys at law perform advocacy.
