Abstract

This diploma theses resolves continuous elimination methods. The goal was to find out nurses´ knowledge needed to operate elimination machines in intensive care and availability of practical material that would make these operations easier. Evaluation was build up on questionare survey which included 90 respondents and the results show that the nurses´ knowledge are not adequate enough even though materials are present for the majority of the nurses. In conclusion a proposal of recommendation is made for practice in which better and more superior materials should be established in which my thesis should be used as a foundation.

Key words: knowledges, continuous elimination methods, nurse, intensive care, dialysis
