

My work called „Nursing process at a child suffered from portal hypertension“ have been divided into two basic parts. The first part is theoretical, the second one is practical.

In the first half of my work I deal with anatomy and physiology of liver, gallbladder and gallbladder ways. In the second part I mention characteristics of the disease, a clinical picture of portal hypertension, a general assesement leading to diagnosis of this disease.

In the first part I have mentioned basic information about the disease, course of hospitalization, investigative methods and therapy survey.

In the practical part I use the investigative process model, which goes out from the „Functional health“ by Majora Gordon. Thanks to gained information from the medical documentation, from the patient, patient's mother and other medical stuff I analyzed all problems and set out actual and potential nursing diagnosis before and after the surgical intervention. I describe realization and evaluation of nursing interventions.

In the end of my work I dealt with the patient's education and also with patient's mother's education. The aim of the education was to advice and to adhere to medical and nursing instructions, to hand over sufficient of information about consequences and answering all questions, that have been in my competence.
