

Annotation

This bachelor's thesis focuses on the cooperation between a nurse and a physiotherapist in care of a patient at intensive care units. It supplies information on negative effects of immobility on human organism and the possible precautions of secondary complications.

The central point of the thesis is a quantitative research aimed at the manner, form and efficiency of conducting individual tasks of the rehabilitation treatment by nurses during close cooperation with physiotherapists. The studied sample is constituted by health care personnel of the general nurse branch and physiotherapy during the execution of their professions in a health care institution in Hradec Králové.
