

Annotation

Bachelor's thesis is focused on the quality of life after revascularization procedures. The aim of the theoretical part of this thesis is to conceive a view on measurement of quality of life, different methods of its measurement and factors that can influence it. There are also summarized the diagnostics of arterial disease and risk factors that can negatively influence the health status of human population. Prevention, treatment and different kinds of revascularization procedures are accentuated.

Crux of the thesis is made by quantitative survey (by questionnaires) focused on the influence of the disease and its treatment on the quality of life. The sample of population examined here is formed by 50 respondents, who have undergone a revascularization procedure in "Pardubicka krajska nemocnice a.s." at the period of time starting 10 years ago up to 1 month ago and who are periodically attended at the outpatient clinic of this hospital.
