

## Annotation

The Bachelor thesis concerns communication with patients having the artificial pulmonary ventilation. The theoretical part is dedicated to problems in the field of communication and artificial pulmonary ventilation. However, its main knowledge domain is mapping the possibilities of different communication methods and techniques with focus on people that are unable to communicate in a usual way.

The empirical part of the study discovers awareness and skills in the field of communication among nurses who work with these patients. As a part of my thesis there are also two interviews with patients who communicate untraditionally.
