

Annotation

The bachelor skript approaches the duality of healthcare in patients with complete endo-prosthesis of hip joint. The skript is divided into theoretical and empirical part. Theoretical part is built from two parts. First part concerns the duality of healthcare and second part is dedicated to the problem of complete endo-prosthesis of hip joint. Empirical part is based on questionnaire investigation. The investigation was applied in selected patients group from rehabilitation department in Regional hospital Pardubice. Three areas were investigated: condition of information, satisfaction with performance and behavior of healthcare personnel and perception of pain and interest of healthcare personnel in patient's care.
