

The topic of atherosclerosis and its complications is currently the subject of much attention because it is a very common disease and the complications caused by her dying a large number of people. Cardiovascular disease (CVD) is the cause of 30% of all deaths worldwide. In the Czech Republic are the main cause of CVD death (in 2004 contributed to the overall CVD mortality of 51, 4%). 8

The topic I chose it because I care about, and in his medical practice with him will meet.

I consider the prevention of atherosclerosis for a better solution than to treat complications or consequences that disease caused.
