

Abstract

Title: Case study of physiotherapeutic treatment of a patient after ischemic stroke

Aims: The aim of this bachelor thesis is to characterize the disease of stroke in the theoretical part and in the practical part to elaborate a case report of a patient with this diagnosis.

Methods: The processed case report consists of anamnesis, initial kinesiological analysis, short-term and long-term therapeutic plan, daily therapy record of ten therapeutic units, final kinesiological analysis and evaluation of the effect of therapy.

Results: The evaluation of the effect of therapy shows that there has been a significant improvement or overall elimination of most of the patient's functional and motor deficits.

Keywords: Stroke, ischemic stroke, left hemiparesis, rehabilitation, physiotherapeutic treatment of a patient after ischemic stroke
