

Abstract

Title:

First aid knowledge of students of FTVS UK and FSV UK

Objectives:

The main objective was the comparison of students of The Faculty of Physical Education and Sport of Charles University and of The Faculty of Social Sciences of Charles University with the help of online survey. The secondary objective was to find out if there is a significant difference between male and female students and between individual years of study.

Methods:

The collection of data was done by means of online survey. The questionnaire was created with the help of Google Forms software and subsequently distributed through the website Facebook. 64 respondents replied to the survey. After the data were collected they were downloaded as Microsoft Excel file and subsequently encoded and statistically analysed. The Microsoft Excel software was used to compute measures of central tendency (arithmetic mean, mode and median) and measures of dispersion (variance and standard deviation) of subsamples.

Results:

Considering the size of sample of FSV UK students, the only differences that were tested for were between FTVS UK and FSV UK students, between male and female FTVS UK students and between the group of FTVS students who study at the faculty for three years or less and group of FTVS students who study at the faculty longer.
