<b>Keywords:</b>	assisted reproduction, infertility, infertility treatment, quality of life affected by assisted reproduction, assisted reproduction centre, nursing care in reproductive centres

The bachelor thesis deals with assisted reproduction, infertility and specific quality of life.

The theoretical part deals with the problems of assisted reproduction, its history, development and methods, it is devoted to infertility and the examinations that are carried out before starting its treatment. It also focuses on quality of life, both general and specific quality of life affected by assisted reproduction. The thesis also looks at nursing care and the role of the general nurse in reproductive centres.

The empirical part depicts the results of qualitative research, which was carried out in the form of interviews with the respondents. The aim of the research was to find out whether the infertility treatment affected the couple's quality of life and social relationships, whether any complications occurred during the treatment, what the respondents experienced during the whole process and whether they would change anything about the treatment, and also to map the assisted reproduction centres.
