

Abstract

Title: Influence of the educational programme on pupils awareness on the provision of first aid

Objectives: The main goal of my bachelor's thesis is to create an educational program for fourth-grade students to improve their knowledge of first aid provision. Another goal is to find out whether the completion of the program was beneficial for the pupils, i.e. whether they acquired new knowledge.

Methods: The educational program was created on the basis of the methodical guide First Aid for Schools by authors Mgr. Michaela Havel and Bc. Tomáš Pinkr, which was created according to the recommendations of the Ministry of Education and Sports (hereinafter MŠMT). The research set, which was presented with a self-design questionnaire with closed questions to establish the knowledge of first aid provision to date, consisted of 46 pupils of the fourth grade of the elementary school. After that, the pupils completed lessons according to the proposed educational programme and were presented with the original questionnaire after five days. The results were then compared and processed.

Results: It succeeded in creating an educational program on the subject of providing first aid for fourth-grade students. The questionnaire survey confirmed that the completion of the program improved pupils' knowledge of first aid by more than 10 %, so its benefit can be confirmed.

Keywords: education, knowledge, younger school age
