Title:

The Model of Human Occupation: translation and adaptation of the tool „The Role checklist“ and its use in working with people psychotic disease.

Abstract:

This thesis explores the use of The Role Checklist, version 3 (RCV3) and its use in working with people with psychotic illness. The aim of the work is to translate the questionnaire and part of the RCV3 manual into Czech language and to test its comprehensibility with patients with psychotic illness.

The thesis is intended to highlight the importance of participation in social roles in patients with mental illness. The thesis seeks to introduce the basic issues of psychotic illness, the impact on the performance of social roles, their assessment and the relationship of the issues to occupational therapy.

The thesis is a pre-research of the RCV3 tool using quantitative data processing with categorical data analysis (descriptive statistics). The main method of the thesis is a questionnaire conversion process that involves back-translation.

Data analysis provides insight into the administration of the instrument by a sample of respondents and subsequent synthesis offers an overview of patient participation in each role, patient satisfaction in the roles or the level of need for participation. It also offers respondents' reactions to the RCV3 and their suggestions for modifying certain items.
