

RDFa is a set of extensions to XHTML which allows to annotate XHTML markup with semantics. Because XHTML does not offer much semantic annotation potential itself, the RDFa language was proposed to relieve this shortage by combining XHTML and semantic web technologies.

While semantics is being described by ontologies, the XHTML documents are linked to ontologies concepts by RDFa extensions. In the present work I tried to create and describe an editor that could make RDFa annotation easier. In addition to direct annotation with context attributes hints it provides ontology imports with drag&drop items insertion and extracted RDF triples preview.
