

## **Abstrakt**

The thesis examines the concept of environmental security in Russia from the perspectives of politics and law, the academic sphere, business entities, and media. The theoretical basis was built on the works of authors who contributed to expanding the security concept regarding environmental threats. The practical part consists of discourse, content, and thematic analysis. It was found that the concept of environmental security in Russia is currently under development and encompasses not only ecological but also political and economic aspects. The scientific community plays a key role in incorporating new threats into the concept of environmental security. While the government of the Russian Federation and the business sector acknowledge the importance of environmental security, their roles are somewhat limited. International standards and commitments in the field of climate change are crucial for the state and business entities. However, the state does not provide significant assistance to companies in this regard. The government responds well to events such as accidents or pollution resulting from private sector activities. However, the elimination of negative impacts on the environment does not always occur. Presumably, some companies operating within significant sectors in Russia can communicate with the government, resulting in the subsequent neglect of environmental issues and endangering the population.

**Key words:** environmental security, environmental policy, climate change, securitization, Russia
