

In my dissertation, I address problems of vision therapies in early and preschool age of children.

I am explaining each single term related to some kinds of vision therapies, sight perception and sight functions in the theoretical part. I also mention facilities for disabled children of preschool age.

In the practical part of my dissertation, I address accessibility to aids for visually handicapped children in preschool age. I am comparing situation of children in special preschools with children being integrated and children, which do not go to preschool. I am trying to find out, how common printed informations are available and which aids are used most.
