

SUMMARY

Institution:

Charles University in Prague, Faculty of Physical Education and Sport
Department of Kinanthropology and Humanities

Name of the work:

Activation therapy as a support of perception of the clients in the chronic intensive care

Name and Surname of the Author:

Bc. Lucie Růžková, DiS.

Field of study:

Adapted Physical and Occupational Education

Name and Surname of the work Leader:

PhDr. Jana Jebavá

The goal of the work:

The goal of this work is to deeply penetrate into the problematic of clients with the most serious handicaps and to support their changes, which are very limited. These mean: the support of perception, activation therapy and other chances to improve the quality of nursing care, which is provided to the patients.

Methodology:

The first phase of development work is devoted to study of available sources and obtaining information on the problems of chronic intensive care, physiology and pathophysiology of consciousness, the activation treatment and basal stimulation. Another important task was to undertake two training symposium BS, vocational training and methodology of art therapy.

Further work is guided by qualitative research. Among the preparatory work of historical research include investigation, analysis of client information and care planning, activation in cooperation with the nursing team and family members in the department DIOP. To meet the objectives, which sets out the practical part of the introduction, use different forms of therapies that can be added to the nursing care of very well integrated. These therapies are: activation and experiential therapy, concept of basal stimulation, music therapy and zootherapy.

The perfect knowledge of the clients' biography and history, personal approach and complying with the particular needs of each klient were the basic conditions to create this plan of actions. The cooperation with the family members and staff nursing is also very important. To be able to integrate the therapy into the care I propose to create such a documentation, which has not been used till now, as a part of the medical documentation and the standard of the nursing care, which will ensure uniform approach to the clients in the future. The case studies of individual clients describe the course of integration of the supporting methods into the care, dead works, information collection, care planning and their realization. The unity of command is also the evaluation, which particular assets bring the techniques for clients, family and nursing staff, what was implemendet into the care successfully, where the problems arose and which possible solutions we found out for the next works with the patients.

Results:

The results of the work are summarized in the chapters Discussion and Conclusion. Elements activation therapy for selected managed care clients to integrate, to become part of it. Activation therapy had a positive impact on clients within the meaning of mitigation of adverse reactions, reduce spasticity of limbs, evoke a pleasant atmosphere in the provision of care and awareness-raising initiatives offered to clients. Very well cooperate families. The nursing staff only some. Further work with clients will require staff training in the concept of BS, and retrofitting department needed tools that are designed for stimulating care.

Key words:

Chronic intensive care, consciousness disruptions, coma vigile, activation therapy, experiential therapy, concept of basal stimulation, zootherapy, biography and history of the client, case study, nursing process.
