

Annotation

Bachelor's thesis is focused on the issue of quality of patients' life before and after cataract surgery. It identifies the impact of this disease on the quality of life from the perspective of patients. The first part of the theoretical work is focused on cataract disease.

104

The second part deals with other possible causes for the sight deterioration, except for cataract. An important chapter is the theoretical part and the quality of life in general, but also contingent visual quality of life.

The other half consists of a quantitative questionnaire survey research, whose aim was to identify patients' problems retrospectively before and after the cataract surgery. The aim of the empirical part was to determine whether there was a set of monitored patients after cataract surgery for the subjective improvement of visual functions and their reflection in the quality of life. The research used an anonymous modified questionnaire. Part of questions from the questionnaire used the questionnaire VF-14. Sample consists of 155 respondents, who were diagnosed cataract. The research investigation was carried out from October to December 2008 at the ophthalmology Department of the Litomysl hospital.
