

Annotation

Bachelor's thesis talks about relationship of infants nutrition in the first half year of life and incidence of allergies in later life. Theoretical part deal about two main points. First part discuss infants nutrition, especially lactation, breast milk and artificial feeding. Second one is about allergic disease, contains brief overview including diagnosis, prevention and treatment.

Research part targets the possibility influence of nutrition in infant age to incidence of children allergies. The Research sample consists of children in age from 1 to 10 years. Children are divided into two groups – without allergy and allergic children. The Results of both groups are compared together. The research data collection was located to Children's Clinic, Faculty Hospital Hradec Králové.
