

The task of the work is to design and implement an information system for a travel agency. The system is supposed to assist at business of a small travel agency. Editing of capacities, booking and selling, voucher printing and sale statistics are all problems to deal with. Application is designed only for inside use in a travel agency and for its contract partners, it's not intended as a booking software for clients. There are some accountant information and cost items in system because of this focus. Coffers control can be managed thru the application interface and user management is of course also part of this application. The system allows mass import of data due to a lot of data which have to be inserted into it.
