

This bachelor thesis concerns with the deserted village in the location ák
in Klánovice

forest. This archaeological site has not been comprehensively researched yet. The findings are based on non-destructive archaeological methods and analysis of analogies of so far surveyed villages. The critical revision of previous modest pieces of knowledge was made, analysis of written sources and a geodetic-topographical survey of the village relicts was carried out especially. It was possible to obtain detailed drawing to restore resident form and to adumbrate the appearance of yards of particular estates.
