

Abstract: The topic of this bachelor thesis is word problems with percentages. I deal with the theory of both word problems generally and word problems with percentages in two first parts. I present the basic methods of calculating in the first practical chapter. Other chapters consist of more difficult and complicated word problems, also connected to other types of word problems. Basic financial math is included. I introduce different topics of word problems with percentages in the final chapter. The aim of my thesis is to sort out and divide word problems with percentages used in textbooks and workbooks for primary and secondary schools, so it could be useful for both solvers and pedagogues.

Keywords: word problem, percents, percentages
