Abstract: The aim of this work is to explore the possibilities offered by the PHP language in combination with the Apache web server and MySQL database in order to implement a web application. This web should be able to compete with other similar applications on the internet, especially in the field of real estate, both by its functionality and graphic design. A significant part of the task should consist of the design of the application. Consequently, our objective was not to find and use the most suitable framework or other tools of support, such as content management system. The programming phase of the project was then done using the methods of Object oriented programming.

Keywords: web application, PHP, XHTML, JavaScript
