

This BA dissertation evaluates archeological discoveries from a burial-ground dated back to the early Roman period which was discovered during a ploughing 1,4 km southeastern far from a village Ohnišťany (Distr. Hradec Králové). Most of the findings became a part of a depository of National Museum in Prague (56 finds). Eight graves with brooches, knives, scissors and weapons are preserved. The disturbed graves have afforded a number of roman provincial imports – bronze vessels (for example a service of a dipper and a strainer of a type Eggers 162 with a stamp of a producer C MANSVANNII) and brooches from eastern and western provinces. Distance contacts from territory of Baltic tribes are documented by a belt fastener. In the place of a present village a contemporary settlement is evidenced by field observations. The large number of imports evidently relate to a very good connection with a trade network.
