

ABSTRACT

The thesis focuses on ecology education programmes that could be used to complement the syllabi of geography at schools. Such programmes are being organized by ecology education centres all around the country. In the thesis the reader will find out how do the centres work and a lot of information about their programmes.

The aim of the thesis is to select geography oriented programmes from all those organized by individual education centres. Then the thesis evaluates the programmes from several viewpoints – the amount of geography oriented programmes offered, the age the programmes are designed for and their forms. In addition, the thesis evaluates individual counties. The practical result of this thesis is a list of geography oriented ecology education programmes sorted by county and topic.

Incorporated into the thesis is a short work on Fair Trade held programmes and simulation games, which are very often offered by ecology education centres.
