

*Abstract:* This thesis deals with the geomorphological analysis and the development of the Sazava River valley's relief near the confluence with the Želivka River between Vlastějovice and Posadovský Mlýn. Its focus is set on the abandoned pleistocene valleys in this area. The main result is the elaboration of a detailed geomorphological map with the scale of 1:15 000 and the interpretation of the relief analysis in the studied area. Based upon the interpretation, the main stages of the geomorphological development of the middle part of the Sázava River valley in the Late Cenozoic were stated and recent geomorphological processes evaluated.
