Abstract

The purpose of my bachelor thesis is to sum up the findings related to *spina bifida* and to list opportunities of using physiotherapeutic approaches and methods in individual forms of this development congenital disorder.

The thesis is divided in two parts – practical and theoretical. In the theoretical part, I tried to sum up the information gathered and these were then applied in the practical part. I provided a detailed explanation of different types of *spina bifida* as the surgery treatment and physiotherapeutic intervention depend on the clinical picture of individual forms of this disorder.

In the practical part, my focus was the application of concrete physiotherapeutic approaches and methods in selected patients suffering from *spina bifida*.
