Every day the number of people using social networks, where you create your network of friends from different areas of interest, is growing. They share experiences and valuable advice. The aim of this work is to implement a social network for travelers. The network enables travelers to create their own maps of visited localities. The users are able to write travel diaries corresponding these localities, which they can share with their friends or publish them. Social network is also designed for travel agencies. Tour offers will be sent from their profile to selected user inboxes. WIWIL - social network for travelers will be programmed in PHP and will use the services of existing network Facebook.
