

Communication is one of the basic human expressions and needs. The Internet is ranked among its main means due to its flexibility, functionality and popularity. In this work I create application used for nonverbal form of communication. It is implemented as website accessible on the Internet. Specialization of this web system is in non-interactive communication of groups of people who are connected by common interest. Application users are allowed to communicate in chat rooms, create various groups with messages boards for their hobby clubs, send messages to other members or write own blog. Application support RSS, a family of web feed formats used to publish wall post of groups. Key features are good accessibility of service, intuitive application usage and multi-language support. Application is programmed in scripting language PHP. MySQL database is used as database management system of application data.
