

## **Abstrakt**

This bachelor thesis contains 190 minor place-names from a part of the Žďársko region. Three types of minor place-names, which correspond to the three main chapters, are examined: hydronyms, oronyms and land names. The minor place-names belonging to a given group are listed alphabetically in each section. Each name is given the type of geographical unit and sources from which it was read out. The main objective of this work is to determine the origin of the examined anoikonyms. This research deals with word formation analysis and distribution of minor place-names into groups according to their significance. Various methods of collection, analysis and interpretation of the collected data were applied to create this work. A number of different printed materials, journals and internet resources were used to explain all the examined entries. It was necessary to attend an interview with witnesses or experts in the discipline of analysis, too.
